Material Sampling Technologies Milling Processing Expansion Project

N. Smithfield, RI – October 27, 2010 – MST pushes the start button on its new milling processing expansion project.

After months of fabrication and installation, MST is now ready for increased productivity in its Milling Department. Tripling its previous capacity, the newly installed milling process will allow the company to process larger customer lots, in an efficient and timely manner. This new equipment consists of additional ball milling capacity, as well as a screening station, and a blender for final sampling.

"This added capacity and machinery will not only triple our production capacity, but also allow us to process the material of multiple customers simultaneously, thus reducing backlog as well as settlement times" said MST's General Manager, Craig Haddad. "We've seen a steady increase in incoming materials, and we want to be able to service our customers in a timely fashion. This new expansion project will allow us to do just that."

MST has plans to add additional processing capabilities in other areas in the very near future.
